TITLE: The Junction (Plane) Triode as a Current Distributor

PERIODICAL: Elektrosvyaz', 1959, Nr 9, pp 44-50 (USSR)

ABSTRACT: Although the matrix method, in conjunction with four-terminal network theory, is a general and flexible means of analysis of junction triode circuits, it has the disadvantage for newcomers to the subject that it is not very illustrative of the processes occurring in the circuit. The object of this article is to develop a basic equivalent circuit for a low-frequency semiconductor triode circuit and to obtain practical, illustrative design formulae. The author defines the term "current distributor" as a circuit junction (knot) such that the current flowing to the junction from one or more paths divides amongst the remaining paths in strictly determined ratios, independent of the impedance of the remaining paths. The proposed equivalent diagram of a junction triode connected as a common-base circuit is given in Fig 1. The resistances r_g , r_o and r_k represent, respectively, the emitter, base and collector resistances. The current distributor is

Card
1/3

SOV/106-59-9-6/13

The Junction (Plane) Triode as a Current Distributor
represented by the small ring. Whilst Kirchoff's first (current) law can be applied to the distributor, the second (voltage) law cannot be applied to all the circuit. The circuit to which Kirchoff's second law is inapplicable is denoted by a break in the circuit, but this does not imply a break in the current path. To analyse the properties of the equivalent circuit, the circuit is characterised by the h-parameters (Eq 1) where h_{11} represents the input impedance with the output terminals short-circuited, h_{12} represents the effect of the output voltage on the triode input circuit ($\frac{U_1}{U_2} I_1 = 0$), h_{21} characterises the distribution

of the emitter current between the collector and the base circuits $(\frac{I_2}{I_1})_{U_2=0} = -a$, and, finally, h_{22}

Card
2/3

represents the output admittance of the triode with the input circuit on open-circuit. These values are determined in terms of r_o , r_k , r , and a .

67379
SOV/106-59-9-6/13

The Junction (Plane) Triode as a Current Distributor

The operation of the circuit with a low-load impedance is first analysed and simple relationships (Eqs 5' to 17) for the current distribution ratios and the input impedance are obtained, but these results are strictly true only when the load impedance is zero. The theory is then generalised for any load impedance. Finally, the parameters of the equivalent circuit are determined in terms of the h-parameters, (Eqs 39-42). To show the application of the results, the voltage gain of the triode stages in the circuit of Fig 6 is calculated. The example shows that the calculation work involved is much less than in the matrix method, the formulae are relatively simple and reflect the physical processes occurring in the triode.

TITLE: On the Reverse Collector Current in a Junction Transistor

PERIODICAL: Radiotekhnika i elektronika, 1960, Vol 5, Nr 5.
pp 806-810 (USSR)

ABSTRACT: It is claimed that the reverse collector current with open-circuit base I_{C0e} rather than I_{C0} , the reverse collector current with open-circuit emitter is more convenient to use in the design of transistor-amplifier circuits. This is because it is I_{C0e} which actually flows in the circuit with cut-off base. The theoretical formula given for calculating I_{C0e} from known I_{C0} and α or β usually gives values greater than actually measured. This is because I_{C0} as measured usually includes leakage currents. Formulae are given for calculating operating point and temperature-stabilization circuits based on I_{C0e} . Measurements on 140 transistors indicate that in 81% the calculated value of I_{C0e} was greater than measured while for only 12.4% were the measured and calculated values within 5% of each other

Abstract : A rare case of a combination of cancer of the cervix of the uterus and ectopic pregnancy was observed in a 39-year-old patient. Radical abdominal hysterectomy with bilateral oophorectomy and pelvic lymph node dissection was performed. On histological examination the vaginal part of the uterus revealed squamous cell, non-cornifying cancer. The patient was discharged after 40 days in excellent condition.

Beetle with BHC Aviation Spraying and the Forecast of
Its Appearance.

Orig Pub : Byul. rastit. sashchita, 1957, 6, No 4, 52-56

Abstract : In 1957, the initial-for-Bulgaria spraying, with 12% BHC
(27 kg/ha), of vegetable cultivations and 60 hectares of
an oak forest took place in the control of the May beetle.
Complete destruction of the beetles was obtained; there
were found in the soil neither eggs nor larvae of the 1st
generation. If spraying is repeated in 1958, a mass ap-
pearance of the pest's larvae will not occur until 1964.

TITLE: On the Problem of Identifying Fossil and Recent Pollen of
the Water-Caltrop (Trapa L.)
(K voprosu ob identifikatsii iskopayemoy i sovremennoy
pyl'tsy vodyanogo orekha)

PERIODICAL: Doklady Akademii Nauk SSSR, 1958, Vol. 118, Nr 4, pp.819-822
(USSR)

ABSTRACT: The first author (reference 11) determined the pollen from
the Oligocene deposits of the Bel'skaya suite (references
2, 3), which was also reported by many investigators from the
tertiary time in the vast region between the Atlantic and
the Pacific Oceans, as water-caltrop (Trapa L. in the more
general sense). After a bibliography on recent and fossil
Trapa pollen the authors give a description of this pollen
and figures (5 species, figure 1). They state themselves
that hardly any morphological differences between the spe-
cies can be seen in this figure (reference 16 states the
same fact). In the arrangement according to their size the

Card 1/3

20 -118-4-54/61

On the Problem of Identifying Fossil and Recent Pollen of the Water-Caltrop
(Trapa L.)

smallest pollen grains are those of T. hyrcana, T. caspica and T. astrachanica, whilst those of T. Komarovii and T. tumberculifera are the biggest (table 1). The first group gravitates towards Europe, the last one towards the Far East and Japan. Though only few grains were measured and though the size of the grains is not at all a decisive parameter, some conclusions can be drawn. The comparison of the tertiary pollen from sediments of the West Siberian plain and of the Turgayskaya depression shows that it can be identified with the European and Asia Minor species. The fossil Trapa pollens from the tertiary of the Far East, Sakhalin and other regions of the Pacific Ocean are different, and their analogies must be found among the Trapa species occurring there. Thus in the first approximation the fossil Trapa pollen from the tertiary of Europe and of the Asian part of the USSR can be separated in two groups: a European (Atlantic) group and an East Asian (Pacific) group. The climatic differences of these regions which led to such a differentiation already existed in the Palaeogene period. There are 1 figure, 1 table, and 26 references, 16 of which are

TITLE:

Fossil Fungi in the Tertiary Deposits of the Yenisey Chain

PERIODICAL:

Doklady Akademii nauk SSSR, 1959, Vol 128, Nr 4, pp 827-829
(USSR)

ABSTRACT:

In spite of the low number of publications on fossil fungi these remains are not so rare as is generally assumed (Ref 5). It is rather the difficult identification and species determination and therefore their little value as leading fossils which are to blame for the low number of publications on this topic. The development of palinology opens new and better prospects for the investigation of fossil fungi (V. P. Grichuk, Ref 4). However, not much has hitherto been done in this field either (A. A. Larishchev, Ref 6; A. A. Chiguryayeva, Ref 11). The two last mentioned research workers believe that the fungus flora to be taken into account in the palinological analysis may be also used for the purposes of stratigraphy and paleogeography. Several papers (Refs 3, 7, 14, 17-22) deal on the whole with Tertiary fungi. The above fungi are also connected with the Paleogenic deposits. The present paper discusses the fungus flora of the Bel'skaya

Card 1/3

Fossil Fungi in the Tertiary Deposits of the
Yenisey Chain

SOV/20-128-4-53/65

suite (Ref 2) of Middle Upper Oligocene. The main mass of this material is concentrated in the earthy brown coal (in agreement with Refs 18, 22). A considerable quantity of Trapa natans (Ref 8) pollen was also found here. The main species are given in figure 1. The incomplete material renders the accurate stratigraphic - and species determination of these fungi impossible. The following principles, may, however, be established already now: (1) Fossil fungus remains may be obtained in a way suitable for a scientific treatment by means of the analytical methods of palinology. (2) By this way the mentioned remains were found in all continents except Africa, South-America, and the Antarctica. (3) In Tertiary they are mainly bound to soft coal. (4) Among them there are widely distributed species and others bound to these or those regions. (5) The Bel'skaya suite contains several species which had already been found in western and eastern Europe, Caucasus, and South-Ural. There are 1 figure and 22 references, 12 of which are Soviet.

TITLE: Vertical distribution of air temperature and humidity in the zone of warm fronts over the Ukraine *B71*

SOURCE: Kiev. Ukrainskiy nauchno-issledovatel'skiy gidrometeorologicheskiy institut. Trudy, no. 43, 1964. Voprosy sinopticheskoy i dinamicheskoy meteorologii (Problems in synoptic and dynamic meteorology), 120-125

TOPIC TAGS: atmospheric front, air humidity, air temperature, atmospheric warm front, cloud formation

ABSTRACT: The purpose of this study was to determine the characteristics of the vertical distribution of air temperature and humidity in the zone of warm fronts over the Ukraine. Since, in the warm season of the year, these fronts are poorly developed during passage over the Ukraine, the study has been limited to an investigation of warm fronts moving in different directions in the cold season. Winter and spring data are compared. Taking into account that physical geography affects the distribution of meteorological elements in the warm front zone to a considerable degree, especially with height, the study was limited to two stations: Kiev and Khar'kov, situated at the same latitude, in the same physico-

L 16891-65

ACCESSION NR: AT5000705

geographic zone, but 400 km apart. Cases of the passage of a warm front over the mentioned stations or within 50 km from them were selected from weather charts. A total of 336 such cases for the period January-May 1957-1961 were selected. The authors present considerable data on the characteristics of warm fronts in the Ukraine during the mentioned months. In the zone of a warm front moving in the lower kilometer layer there is either an inversion or a slow temperature drop with height when the moisture content of the air is high. In the warm air mass above a warm front the temperature decreases uniformly with height, regardless of direction of movement of the front. Variation of relative humidity with height is not identical under different synoptic conditions, and is in all probability evidence of a different thickness of the frontal clouds. Orig. art. has: 1 figure and 3 tables.

TITLE: Investigation of reliability of contactless-element switching circuits

SOURCE: IVUZ. Elektromekhanika, no. 2, 1964, 228-238

TOPIC TAGS: switch, cyclic switch, sequence switch, contactless switch,
contactless switch reliability

ABSTRACT: The successive cyclic switching of channels in telemeter or remote-control systems is theoretically considered. An optimum structure of the (ring or binary) switch scheme is determined on the basis of the number of channels N and failure rates of the scheme components. Formulas for the number of transistors, diodes, and the faultless-operation probability are developed for the

Short Reports (7) (Korotkiye soobshcheniya)

Zavodskaya Laboratoriya, 1957, Vol. 23, Nr 11, pp. 1395-1395 (USSR)

PERIODICAL:

The author contends that, on the strength of his long experience in carrying out analyses of silicates, he found that the platinum crucible usually used in certain cases can be replaced by nickel crucibles. This has the advantage that in nickel crucibles it is possible to melt with lye solutions, which permits a more rapid decomposition of the components of soda or Na_2CO_3 . In this case there can be attained the possibility to carry out smelting already at temperatures of 400-500° so that correspondingly, a time of 2 - 3 hours is taken than otherwise when smelting is carried out in soda, temperatures of up to 850-900° and, correspondingly, a time of 2 - 3 hours is needed. Experiments specially carried out showed that nickel is only in a low degree soluble in hydrochloric acid. (Crucibles of 29.5 g weight lose 2 mg in 1 hour).

Quantities of nickel can hardly impede experiments, and possible to remove the nickel content by pre-

TITLE: Stabilization of a powerful Penning discharge by a radially increasing magnetic field

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 49, no. 1, 1965, 27-30

TOPIC TAGS: plasma stabilization, Penning discharge, flute instability, two stream instability, electron temperature

ABSTRACT: The authors investigated the effect of a radially increasing magnetic field produced by a stabilizing system of six rods, each neighboring pair of which carries current in opposite directions, on the development of instability in a powerful cold-cathode Penning discharge. The magnetic field produced by the current-carrying rod system was described by M. S. Ioffe and R. I. Sobolev (Atomnaya energiya v. 17, 366, 1964). The discharge apparatus is illustrated in Fig. 1 of the Enclosure. The plasma parameters were determined by means of movable Langmuir probes and from transmission of a microwave signal of 8 mm wavelength. The unstabilized plasma was almost completely ionized, and the electrons in the discharge had a density $(1-6) \times 10^{15} \text{ cm}^{-3}$ and a temperature fluctuating between 50 and 75 eV. The measured spectrum of the oscillations consisted of quasiharmonic

Card 1/3

L 63103-65

ACCESSION NR: AP5019212

low-frequency pulsations at $10^4 - 10^5$ cps and random noise in the $10^6 - 3 \times 10^7$ cps range. The movable-probe measurements showed that the low-frequency oscillations can be identified with the previously observed flute instability and with oscillations of the pinch as a whole about the equilibrium position. Turning on the stabilization system reduces the level of the oscillations due to the discharge instability by at least two orders of magnitude. This is accompanied by a sharp reduction of the electron temperature in the discharge if the plasma density is kept constant. An unexpected result of the experiment is the strong stabilizing action of the radially-increasing magnetic field on the high-frequency region of the oscillations in the discharge, associated with the two-stream instability excited by the fast-electron current which maintains the discharge. The nature of this effect is not clear. It is concluded that the high value of the electron temperature in Penning discharges is associated with the turbulent nature of the processes in the discharge. "The authors thank V. A. Yermakov for assistance in the measurements."
